

SONU YADAV

Process Automation Executive

ABOUT ME

Motivated professional with an IT background and hands-on industry experience, applying technical knowledge and analytical skills to drive real-world business outcomes. Skilled in building full-stack web applications, automating multi-stage approval workflows, and conducting data analysis that drives operational efficiency. Experienced in collaborating with cross-functional teams to translate business processes into production systems, with demonstrated success in delivering G Suite integrations and automation tools with measurable business impact.

EDUCATION

D. G. RUPAREL COLLEGE
Bachelor's – Information Technology
2024

VIVA COLLEGE
HSC
2020

U.S. OSTWAL ENGLISH ACADEMY
SSC
2018

WORK EXPERIENCE

Crystal Group

Process Automation Executive – October 2024 – Present

- Architected and shipped a company-wide Transport Order & Payment platform in Next.js 14 and React, replacing a chain of Google Forms and Apps Script tools with a single stage-gated pipeline spanning delivery order creation, vehicle placement, payment approvals, dispatch challan and delivery confirmation.
- Digitised two multi-level payment approval chains with conditional routing, approver comments, hold/reject and resubmit loops, and automated email notifications, cutting approval turnaround times and removing manual follow-ups.
- Engineered JavaScript based sales order workflow automation, significantly reducing processing time by 40%.
- Developed comprehensive Inventory Management System with automated tracking and reporting capabilities, reducing manual errors by 75%.
- Built Sales Dashboard to track daily, weekly and monthly call status and summarize data for monthly reports, reducing task backlogs by 60%.
- Created Vue.js Indent Web Application with Google Apps Script backend featuring digital approval signatures.
- Implemented cross-departmental Accounts FMS with automated billing approval workflows and reminder systems.
- Built Dashboard on Looker Studio to keep stakeholders updated with their pending work in SOPs.

Excelerate – Internship

Data Analyst Intern – June 2024 – July 2024

- Performed in-depth analysis of market trends and Facebook advertising performance metrics using Python.
- Optimized ad campaigns based on performance data analysis, improving ROI and conversion rates.
- Delivered strategic recommendations to stakeholders using data-backed insights, and led project execution with an emphasis on data-driven decision-making.

SKILLS

- **Programming Languages:**
JavaScript (ES6+), Python, HTML5, CSS3, SQL
- **Frameworks & Libraries:**
Next.js, React, Vue.js, Node.js, Express.js, NextAuth, Pandas, NumPy
- **APIs & Integrations:**
REST API design, Google Sheets / Drive / Docs APIs, OAuth 2.0, SMTP & automated mailers
- **Database Systems:**
PostgreSQL, SQL Server, MySQL Workbench, Azure Data Studio
- **Cloud & DevOps:**
AWS, Vercel, Docker, Git, G Suite Integration, Google Apps Script
- **Analytics & Reporting:**
Power BI, Tableau, Looker Studio, Jupyter Notebooks, Alteryx, R, MS Excel, Google Sheets
- **Soft Skills:**
Problem-Solving, Communication, Project Management, Data-Driven Decision Making

LANGUAGES

- Hindi
- English
- Marathi
- Malayalam

ACHIEVEMENTS

- Delivered an end-to-end order-to-payment platform now used across operations, accounts and external transporters as the single system of record.
- Reduced pending task backlogs by 60% through workflow optimization.
- Streamlined inventory management processes reducing manual errors by 75%.
- Implemented digital approval systems decreasing document processing time by 40%.
- Built real-time Google Apps Script dashboards improving reporting accuracy.
- Built an internal Google Sites hub linking every department dashboard.

PROJECTS

Transport Order & Payment Management System / *Next.js 14, React, Node.js, NextAuth, Google Sheets / Drive / Docs APIs, Vercel*

- Built a single web application covering the full order-to-payment lifecycle – delivery order creation, vehicle placement, advance payment approval, dispatch challan, delivery confirmation and balance billing – with each order's stage advancing automatically as its step completes.
- Implemented role-based access control with Google OAuth for staff and OTP / password login for external transporters, governed by an admin-editable permission matrix that lets management retune approver rights without a code change.
- Developed a vendor portal where transporters submit bills with chunked document uploads to Google Drive, track approval progress on a live timeline and view payment and UTR details.
- Automated delivery order and dispatch challan generation through Google Docs template merges, with the finished PDF mailed to stakeholders and archived to Drive.
- Handled real accounting rules in code – GST/TDS deductions, invoice grouping so one invoice raises a single payment request across multiple orders, and automated reminders for pending bills.
- Delivered management dashboards, a DO register, global search, column filters, CSV export, route maps and a themed design system, plus a key-authenticated read-only REST API for external systems to pull live order status.

Indent Web Application / *Vue.js, HTML, CSS, JavaScript, Google Apps Script*

- Developed a Vue.js application featuring dynamic data management and a digital approval workflow, with full CRUD operations, real-time updates and custom reporting.
- Integrated the frontend with Google Apps Script and Google Sheets, ensuring seamless and secure data flow.
- Automated email reminders for pending approvals to improve user responsiveness and workflow efficiency.

Client Web Portal / *HTML, CSS, JavaScript, Google Apps Script*

- Designed a secure client portal with client-specific login, order details, document access, order progress tracking, installation guides, support tickets and feedback forms.
- Implemented session-based login using browser local storage for persistent access control.
- Built an order progress interface showing shipment stages – Order Placed, Inventory Allocated, Quality Checked, Dispatched and Delivered – using timelines and progress bars.

Grade Management System / *HTML, CSS, Vue.js, Node.js, MySQL Workbench*

- Developed a dynamic Grade Management System with full CRUD functionality, where each grade supports unlimited customizable elements with min/max values, chemical and physical properties and comments.
- Used Express.js for backend operations and architected the system to create a dedicated SQL table per grade, ensuring data isolation and structure.
- Integrated real-time alerts for duplicate entries and administrator controls to view, update or delete grades.
